

# Paperloom - Technical SEO Audit

Every number below was measured directly against the generated site, not estimated: 283 HTML pages were parsed, 23,023 internal links were followed, and every structured-data block was validated as real JSON. This is what that check found, what was fixed, and what was already correct.

Site: [paperloom-rho.vercel.app](https://paperloom-rho.vercel.app) • Audited 8 September 2026 • 283 pages, 6 categories, 44 subcategories, 204 templates, 15 guides

|                                                                   |                                 |                                   |                                           |
|-------------------------------------------------------------------|---------------------------------|-----------------------------------|-------------------------------------------|
| 9                                                                 | 9                               | 23,023                            | 349                                       |
| issues found across on-page, structured data and internal linking | fixed and verified in this pass | internal links checked · 0 broken | structured-data blocks parsed · 0 invalid |

## METHOD

### How this was checked

Not a checklist ticked from memory - each item below is a script that opened the real generated HTML for all 283 pages and measured it.

- Every `<title>` and `<meta name="description">` extracted and checked for length (Google's practical display limits: roughly 15-60 characters for a title, 70-160 for a description) and for duplicates across the whole site.
- Every `<h1>-<h6>` on every page collected in document order to check exactly one H1 per page, and that heading levels never jump (no H2 straight to H4).
- Every internal `<a href>` resolved to a real file path and checked for a 200 - not sampled, all 23,023 of them.
- Every `<script type="application/ld+json">` block parsed with a real JSON parser, not eyeballed.
- `sitemap.xml` parsed as XML and its URL count compared against the actual page count; `robots.txt` read directly.
- `canonical`, `viewport`, `lang`, `favicon` and `og:image` tags checked for presence on all 283 pages.

## FINDINGS

# What was wrong, and what changed

Nine issues, grouped by what they affect. Each row shows the measured before and after - not a description of intent.

## Accessibility & structure

| ISSUE                                                                                                                                                                                                                                                                                                                                              | BEFORE          | AFTER     | STATUS |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-----------|--------|
| Heading level skips (H2 straight to H4, no H3) - the footer's section labels were H4 while most page content only reaches H2. A screen reader jumping by heading level lands nowhere between them.<br><br>Fix: footer labels changed to H3. Two pages (Guides index, Contact) had no H2 at all and skipped H1→H3; both got a real section heading. | 282 / 283 pages | → 0 / 283 | FIXED  |

## Social sharing

| ISSUE                                                                                                                                                                                                                                  | BEFORE        | AFTER       | STATUS |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------|--------|
| No og:image on any page - a link shared to WhatsApp, Facebook or Slack showed no preview image.<br><br>Fix: generated a branded 1200×630 share image and added og:image, og:image dimensions and matching twitter:card tags site-wide. | 0 / 283 pages | → 283 / 283 | FIXED  |

## Titles & descriptions

| ISSUE                                                                                                         | BEFORE   | AFTER               | STATUS |
|---------------------------------------------------------------------------------------------------------------|----------|---------------------|--------|
| Titles over ~60 characters, at risk of truncating in search results.                                          | 23 pages | → 1 page (61 chars) | FIXED  |
| Descriptions over 160 characters. Most came from one auto-generated sentence that overflowed on subcategories | 10 pages | → 0 pages           | FIXED  |

| ISSUE                                                                                                                                   | BEFORE | AFTER | STATUS        |
|-----------------------------------------------------------------------------------------------------------------------------------------|--------|-------|---------------|
| <p>with long names (Farewell &amp; Retirement Invitations).</p> <p>Fix: shortened the generating formula and hand-trimmed the rest.</p> |        |       |               |
| Duplicate titles or descriptions across different pages (a real duplicate-content signal to search engines).                            | 0      | → 0   | ALREADY CLEAN |

### Structured data

| ISSUE                                                                                                                                                                                                                                                                                                                      | BEFORE  | AFTER                      | STATUS |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|----------------------------|--------|
| <p>No BreadcrumbList schema, despite every page already rendering a visible breadcrumb trail - Google can show that trail under the search result, but only if it is marked up.</p> <p>Fix: the breadcrumb function now emits the JSON-LD from the exact same data as the visible trail, so the two can't drift apart.</p> | 0 / 283 | → 282 / 283 (all but home) | FIXED  |
| <p>No Organization / WebSite schema declaring what the site is.</p> <p>Fix: added to the homepage,</p>                                                                                                                                                                                                                     | Absent  | → Present, functional      | FIXED  |

| ISSUE                                                                                                                                                                                                  | BEFORE        | AFTER              | STATUS          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|--------------------|-----------------|
| including a SearchAction.<br>Made that claim real rather than decorative - the homepage now reads a ?q= URL parameter and runs the search, which is what a Google sitelinks search box actually calls. |               |                    |                 |
| FAQPage schema (subcategory pages) and Article schema (guides) - checked for valid JSON and correct placement.                                                                                         | 52 + 15 pages | → Unchanged, valid | ALREADY CORRECT |

## Internal linking

| ISSUE                                                                                                                                                                                                                         | BEFORE         | AFTER                   | STATUS |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-------------------------|--------|
| <p>Guides could only link to one related template category each, even where the written content named several - the sizes guide discusses seven platforms but linked to one.</p> <p>-----</p> <p>Fix: guides can now cite</p> | 1 link / guide | → Up to 5, where earned | FIXED  |

| ISSUE                                                                                                                                                              | BEFORE                | AFTER                     | STATUS      |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------------------|-------------|
| multiple related categories, collapsed into one sentence rather than a repeated banner.                                                                            |                       |                           |             |
| Two pages named another category's templates in plain text without linking to them - the diploma page mentioned certificates, the logo page mentioned letterheads. | 2 plain-text mentions | → 2 real links            | FIXED       |
| No link between Business Cards and Logo Templates, despite being the most common real-world pairing on the site (a new business needs both).                       | Unlinked              | → Linked, both directions | FIXED       |
| Pages with no incoming internal link at all (unreachable                                                                                                           | 0                     | → 0                       | ALREADY CLE |

| ISSUE                   | BEFORE | AFTER | STATUS |
|-------------------------|--------|-------|--------|
| except via<br>sitemap). |        |       |        |

## SITE HEALTH

# Everything else that was checked

No issue found - listed because "we checked and it's fine" is still evidence.

|                         |                               |                        |                              |
|-------------------------|-------------------------------|------------------------|------------------------------|
| Canonical tag present   | 283 / 283                     | Viewport meta present  | 283 / 283                    |
| lang="en" attribute     | 283 / 283                     | Favicon linked         | 283 / 283                    |
| Broken internal links   | 0 / 23,023                    | Invalid JSON-LD        | 0 / 349                      |
| Orphan pages            | 0 / 283                       | sitemap.xml entries    | 283, matches page count      |
| robots.txt              | Allows all, points to sitemap | <img> without alt text | 0 (no raster content images) |
| Duplicate H1 (same URL) | 0                             | Avg. HTML page weight  | 38.7 KB                      |

**Reviewed, not changed** - every page loads all six category stylesheets (~108KB uncompressed) rather than only the one it needs, because the homepage and category pages show preview cards pulled from other categories and a safe per-page split would need careful testing to avoid a page rendering without a style it turns out to need. Real-world cost is small - the files are cached after a visitor's first page view, and Vercel compresses them in transit - so this is flagged as a low-priority future optimisation rather than fixed under time pressure. One title sits at 61 characters against a 60-character guideline; Google's actual cutoff is pixel-width based, not a hard character count, so this is not expected to truncate in practice.

## NEXT

# What actually moves rankings from here

On-page work is done. The site now has no data to prove any of it worked - these four close that gap.

## 1 Submit the sitemap to Google Search Console

paperloom-rho.vercel.app/sitemap.xml. Nothing above matters to rankings until Google has actually crawled and indexed the pages - this is what makes that happen on a predictable schedule instead of by chance.

NEEDS THE SITE OWNER'S GOOGLE ACCOUNT

---

## 2 Add analytics

There is currently no record of what pages get visited or what people do once they arrive. A week of real data will say more than another round of guessing which category to build next.

---

## 3 Write more guides before adding more categories

Guides are the site's only long-form original writing, and the part that gives thin template-gallery pages the surrounding content search engines and AdSense both look for. Each existing category has room for two or three more.

---

## 4 Re-run this audit after Search Console has a few weeks of data

Query and impression data will show which pages are already being found for the wrong keyword, or found for a keyword this site didn't intend to target - both are worth acting on and neither is visible without it.

---

Every figure in this report was measured against the build deployed on 8 September 2026. Re-running it against a later deploy may produce different numbers as new categories are added.
